PLANNING AND ACCOMPLISHMENT NARRATIVE

PART I. REFUGE HIGHLIGHT STATEMENT

Temperatures in January and February followed the long term norm, but March dipped below the recorded average. Precipitation was well above normal, especially during April when nearly three times the normal was received--the records indicate that this was the wettest April on record.

The abnormal precipitation received in the spring raised the Mississippi River to flood stage in mid-March. This was the first of four occasions from March to June that the mighty Mississippi reached or exceeded flood stage. This high water forced furbearers to higher ground and destroyed a few duck and Canada goose nests. However, no significant loss in either furbearers or waterfowl were recorded.

Spring water levels finally receded to the desired summer management stage by late June. Normal summer water levels combined with warm days provided the medium and stimulus needed for terrestrial and aquatic plant growth. Both habitat types flourished under these conditions and provided more than an adequate supply of food and cover for resident and migratory wildlife populations. The Cassville district reported an exceptionally good wild rice crop this year.

The peak waterfowl numbers (195,210) and use days (6,310,633) during the spring period decreased 32.75% and 20.52% respectively compared to same period in 1972. The duck use day total increased 19.1% above the five-year average and 29.8% above the ten-year average. Peak numbers, however, decreased 4.3% below the five-year average but held a slim 2.1% increase above the ten-year record. The 1973 coot use (767,466) and peak numbers (37,825) decreased 34.8% and 40.6% from the five-year average and 31.7% and 39.2% from the ten-year average. Canada goose and swan peak numbers and use day totals decreased substantially from the 1972 total. The long term records show that the spring waterfowl populations fluctuate drastically from year to year. (See material in Part III Appendix).

A total of 1,160 trappers harvested an estimated 163,458 muskrats valued at \$345,814. These trappers harvested 176 mink, 546 raccoon, 89 opossum and 20 fox. A total of 898 trappers in the states with an open beaver season reported taking 1,565 beaver valued at \$28,511.

Enforcement of game and public use violations on the refuge continued to require a substantial amount of refuge personnel time. During the six month reporting period, 46 cases were successfully prosecuted in state courts. Fines from these cases included \$1,710, three days in jail, 36 hours of assigned work projects.

Public use activities, including boating, camping, fishing and hunting have continued to increase with little, if any, encouragement from the refuge. A significant portion of this use is inherent to the refuge program, but the system fails to recognize RBU benefits for the non-wildlife-wildlands activities. The refuge-administered "Hounds Tooth" award has continued to produce positive results in reducing the littering problem.

The wilderness study for the Upper Mississippi Refuge is in its second year. The original proposal has been modified several times to reflect policy changes suggested by the various agencies affected by the study. The modified study now contains provisions for a 8,000-acre proposal instead of the original 45,000 acres. Public hearings on this proposal are tentatively scheduled for early 1974.

Construction activities were held to a minimum because of lack of funding, but those projects completed greatly improved the refuge program. One public overlook was constructed in the Savanna district, and a two-mile auto tour route was begun on the Trempealeau refuge. The local Wisconsin National Guard unit worked on the tour route as a training exercise. Four new 16' flat bottom boats and four Grumman canoes were purchased to replace the 25 year old work boats now in use. Six new outboard motors were also purchased to replace older models.

Bi-monthly safety and staff meetings were conducted for all refuge personnel during the reporting period. There were no lost time accidents during the reporting period.

Dredge spoil and its impact on the ecology of the river has gained regional and national attention this year. A formal dredge spoil survey was initiated in an attempt to gain information to substantiate our past claims of the river's degeneration. Wisconsin court proceedings are pending against the U. S. Corps of Engineers on this subject.

Additional information on refuge highlights are presented in Part I of the attached district statements.

PART II. REFUGE ACCOMPLISHMENTS

A preliminary analysis of our first Planning and Accomplishment Report, Part II, for 1973 strongly indicates that our original estimation of the number of refuge outputs produced on the Upper Mississippi River Wild Life and Fish Refuge were not accurate. Our first attempt at summarizing the refuge outputs was based on our best available information, but the substantiating data for these estimations were lacking. Now, for the first time in the history of the refuge, we have a complete year of fair-to-good information on accomplished outputs. This will be a tremendous aid for future planning. A tremendous amount of effort by the refuge staff went into the accumulation of ultimate summation of this information. We are confident that the large deviation experienced in the 1973 report will not recur in the 1974 submission because of the better information now available.

Following is a breakdown of the major output categories, as summarized in Part II of the P & A report, with a brief explanation of those functions deviating significantly from the planned program.

Wildlife-Wildlands Interpretation:

The accomplished output elements under this category far exceeded the planned units, but this is due, in part, to the inaccurate estimation during the initial planning of the refuge objectives. The much improved output reporting system now established has produced more outputs than originally estimated.

Trails and tour routes were improved on the Trempealeau Refuge with the expenditure of interpretive funds received during the reporting period. Much of the work on this project was done by the Wisconsin National Guard as a weekend training assignment. Public use should increase when the auto route is completed. Walking trails continue to be a popular activity during the fall and spring portion of the school year. Many new school groups are finding and using the Trempealeau Refuge for the various activities in this element.

The other programs category of this major output decreased about 44% from the planned estimation. Again, this decrease must be justified on the basis of inaccurate base information. This is also a category that would normally fluctuate because of the uncontrollable requests throughout the refuge service area.

Environmental Education

Our initial goal for a number of students receiving this educational experience on the refuge was met. However, our estimations for the number of teachers influenced by our program deviated substantially. This deviation is attributed to the Division's change in the environmental education program at this station. Our original total was

based on the projected emphasis generated by the Bureau during this reporting period. Lack of funds and experienced personnel held this activity to the lower figure. Our new projections, however, indicate that we will reach our target during the new reporting period. Trained personnel have been assigned this responsibility and new programs initiated for the Trempealeau Refuge.

The Professional Services element also deviated from the programmed total. Again, this category is dependent upon the specific requests received from the various state, federal and private groups within the service area of the refuge. The refuge has little, if any, influence over this demand. We are confident that as the refuge receives more experience and better base averages so, too, will our future predictions improve.

Wildlife-Wildlands Recreation

The output elements in this category make up a significant proportion of the total refuge outputs. Our original estimations for these elements were surprisingly close to the actual recorded total. We would consider all of the elements in this group within tolerable limits of deviation from the initial estimation. However, the output element, 6-33 (Other Consumptive Recreation) showed a deviation of 89%. This would not be acceptable but is probably understandable when considering the complexity of documenting this type of use.

Non-wildlife Oriented Recreation

The output elements in this public-oriented category are not recognized or encouraged by the refuge system, however, approximately 14% of the accomplished units on this station fall within this group. All of these elements are considered to be inherent to this station and, therefore, a vital part of the O & M operation of the refuge. The costs associated with the administration and operation of these outputs are substantial, but the benefit units are non-existent. We hope that these outputs can be recognized on the UMR in the future.

Any substantial deviations experienced in this grouping are attributable to the climatic factors affecting the anticipated demand on a given day or weekend.

Professional Services

Three of the four output elements in this area deviated in excess of 100% from those outputs programmed. The output elements 6-50 (Studies and Publications) and 6-57 (Other Cooperative Programs) increased 500 and 700% respectively from the programmed units. This departure from the planned total is due, in part, to the base information presented in the original objective-setting process and uncontrollable demand from colleges, universities and contracting companies within the service area.

The deviation reported for 6-56 (Banding) was in error. The two units programmed were achieved, not seven programs as shown on the accomplishment report.

Environmental Preservation

There were no significant deviations recorded on these output elements. An error was recorded in 6-60 (Natural Environments Preserved) as reported in accomplished units. The planned and accomplished units should be the same--195,707 acres. Also, one area should be recorded for element 6-64 (Scientific Sites in Accomplished Units).

Wildlife

A significant departure for the planned units was recorded in 6-71 (Special Recognition Species) and 6-72 (Wildlife Diversity) respectively during the reporting period. In the case of the first, 6-71 (Special Recognition Species) we would justify by indicating that the data collected after the initial estimation was much better than the original data used as planned units. Improved averages will significantly increase the future reporting procedure. The second deviation involving Wildlife Diversity is an error recorded by the system process or in our initial reporting process. The planned and acoomplished units for this element should be the same--253 species--instead of the recorded 1,700 species indicated on the output printout.

Also, a 67% decrease was recorded in accomplished units for species donated. This is a category that is extremely hard to estimate when planning for the year. Any estimate projected would be dependent upon the number of species available for donation during the year. We would consider the deviations recorded in the other output elements as being well within tolerable limits of our original estimation.

Economic Benefits

All elements in this area deviated significantly from the planned units. None of these output elements are considered as benefit producers by the system, however, all of those reported are produced because of refuge commitments. In many cases they are either inherent responsibilities or part of the refuge's General Plan and Cooperative Agreement with the Corps of Engineers.

One area of great concern to the staff has been the neglect of the refuge system to recognize the importance of trapping as a viable refuge output. Each year nearly 1,300 trappers harvest furs valued at \$300,000 to \$500,000 along the Mississippi River. Management of this resource is a must on this refuge because of the close association with waterfowl habitat management. Fur management is in fact a creditable management function, and the refuge should receive benefit units commensurate with the output.

PART III. APPENDIX

UPPER MISSISSIPPI RIVER WILD LIFE AND FISH REFUGE

Violations

January 1-June 30, 1973

<u>No,</u> <u>Cases</u>	<u>Violation</u>	<u>Fine</u>
27	Littering	\$ 1,361.
2	Destruction of Refuge Signs	16 hrs. assigned work
2	Snagging Fish	118.
1	Too Many Fish Lines	19.
1	No Boat Lights	15.
7	Illegal Parking on Access	83.
1	Shoot Song Birds	25.
1	Off Road Vehicle Use	50.
<u>1</u>	Trapping Too Close to Beaver House	<u>39.</u>
43		\$ 1,710.

Three juveniles were assigned twenty (20) hours of work in lieu of a fine for littering.
